One of the candidates for the prize sixty projects WT Award 2011 is the building designed by the young Polish Agnieszka Nowak and Ryszard Rychlicki (2RAM Studio), selected not for its architecture (albeit very welcome), but for a technology integrated in the building that would collect rain water and turn it into drinking water. The project, called simply Skyscraper Rain Collector, has an outer cover formed from a series of channels that are designed to capture rainwater and turn them into drinking water used in the building. In fact, the average daily consumption of water is about 150 liters per person per day and this system is capable of producing more than half.

The structure of the building through a pipe system is able to capture large amounts of rain water and store them in a large funnel that is at the center of the building. With sophisticated filtering system and photosynthesis, the water is purified and then channeled to the apartments. This water can be used for flushing toilets, do the laundry, watering plants and for domestic applications. This project was selected for the WT Award 2011 is very interesting and would improve the quality of life for many people. Water is a valuable asset, and young architects have figured 2RAM study pointing to an issue of great sensitivity.
